has also created a myriad of new ailments, many of which may be difficult or impossible to cure. In
fact, according to the nonprofit advocacy group Health Care Without Harm, there are currently
more than 150,000 people in the US living with at least one condition that has no cure and that can
be managed only by lifestyle changes, pain medications or intravenous fluids. With that in mind,
we've put together a list of the 15 Most Uncurable Diseases and Conditions. As you read, remember
to go beyond medical science, and into science fiction. 15. Konzo The name alone is enough to send
shivers down your spine. Konzo is a condition that is thought to be caused by a bacterial infection
and affects the brain, causing people to go into a state of involuntary muscle spasms. It's believed
that 1.5 million people in the world are affected by the disease. The condition was first documented
in West Africa in the 1950s and the first cases of it appeared in the USA in the late 1960s. 14.
Paroxysmal Nocturnal Hemoglobinuria Pancytopenia, or low blood cell counts, is common in
people with Paroxysmal Nocturnal Hemoglobinuria (PNH). PNH is a condition in which a part of a
person's blood cells turns out to be abnormal. Those affected by the condition can have shortness of
breath, fatigue, and even bruising or bleeding from the nose, 2d92ce491b
