Titanium Kaltland silicon (KSS) wafers were used as substrates for the synthesis of gold nanocrystals. The surfaces of the KSS wafers were oxidized using the thermal process. The surficial atomic layers were destroyed by chemical oxidation and new surfaces were generated. The KSS wafers were used as templates to obtain Au(0) colloidal solutions with different pH values. These solutions were subjected to a chemical reduction reaction in order to synthesize Au nanocrystals. The size, shape and photoluminescence properties of the nanocrystals obtained were controlled by the parameters used in the chemical reaction.Reliability and validity of a measure of functional outcomes for children and adolescents with cancer. Functional status is increasingly recognized as an important outcome in pediatric oncology. However, a valid and reliable measure of functional status for use with pediatric patients has yet to be developed. The current study assessed the reliability and validity of a survey measure of functional outcomes in children and adolescents with cancer. Questionnaires were administered to 77 children and adolescents with cancer in 2 centers that specialize in pediatric oncology care. Patients were administered the Sickness Impact Profile, Functional Independence Measure, and Children's Revised Illness Perception Questionnaire. Patients were also interviewed regarding their symptom burden. High internal consistency and convergent validity were found. We conclude that the Functional Independence Measure appears to have good reliability and validity. As further research is conducted in this area, we hope that the Functional Independence Measure will allow for comparisons of functional outcomes across studies and provide a means to quantify the impact of changes in therapeutic regimens.Photosynthesis in Arbuscular Mycorrhizal Fungi. Arbuscular mycorrhizal (AM) fungi are the most commonly found fungal symbionts of land plants and form a mutualistic relationship with the majority of land plant species. The mycorrhizal fungi serve the plant host by enhancing nutrient acquisition from soil, thus improving plant growth. Plants can also attract AM fungi to their roots. In this review, we summarize the knowledge of the biochemistry and molecular biology of photosynthesis in AM fungi.
