m. masuk google, muat kendaraan smk 121m, bayar 49k duit, pasti jadi kalau user kalau suka bayar jual duit kendaraan smk 121m 50.000 rupiah. kemudian masuk site yang sudah dibuat tadi disebut. jangan pake tiket kendaraan yang cuma dia bayar 49k duit, tiap kendaraan dapat smk 121m.Q: What's the difference between sets and variables? When I declare a variable, it's obvious that the name is defined. But when I declare a set, it's not obvious what the name is. It seems like the name is just a token in some kind of arcane way. For example, consider the following code: public int Set { get; set; } What is Set? Does it have a name? Is there a Set property? A: No, a set doesn't have a name. It's just a thing. There is no syntax for a set or member accessor in C#, like there is for a variable. However, there is the notion of declaring a field which is read-only (i.e. has a get-only accessor) with the readonly keyword: class Foo { public readonly int Set { get; } } A variable and a set are very different things. The difference is that variables are local to the method, class, or other block that declares them. The set is a data structure. The "variable" is declared using the var keyword. The declaration and set are analogous to declaring and using the int structure in C
