cost DICOM-Pictorial Diagnosis (PD) with virtual models, algorithms, PCP-System, and PCP-Medical are part of the following certification E-Truck Life Cycle Management (ELCM) Check-Vehicle-Maintenance (CVMI) Onboard Diagnostics and Autonomous Emergency Braking (OBDA-Safety). Lifetime service with lifetime of parts History The first PCP-Systems were developed in the 1990s in cooperation with the Dutch, Swiss and German vehicle manufacturers. For the first introduction in the market the PCP-Systems were offered as an additional after sales service. The PCP-Systems are controlled by a Windows-based PCP-System-Control-Unit (CBU) with the PCP-Software. The CPCU is connected to the vehicle's onboard computers with an Ethernet cable or by the CAN-network. The PCP-System software can be used for diagnosis and controlling the PCP-System-CBU. Data is transmitted by CAN-networks and LAN, Bluetooth, RS-232, e.g. the OBD-2-Protocol is used for diagnosis and the quality of the USB cable is determined by the vehicle-manufacturer. The USB-Cable for the upload of the data should be of the same length for all vehicle-models. A representative for the PCP-Systems is the VDA. Working principle The CPCU receives commands and information from the user's PCP-Software, drives the measurement devices, and transmits measurement results, control signals and data to the vehicle's onboard computer. CPR is a general term for data that is used by vehicle manufacturers for diagnostics in connection with PCP. The PCP-Systems are certified according to different standards, e.g. the German on-board diagnostic standard OBD2 and the European on-board diagnostics standard OBD-II. The working principle of the PCP-Systems consists of the following modules and parameters: Performance Control Parameter (PCP) Operation Control Parameter (OCP) ECU Parameters All data is transferred via CAN-networks or LAN, Bluetooth, RS-232, and USB. The PCP-Systems receive data via the USB cable and send data via CAN-

I don't know what you think of me (my past) but I want to share what I want to share about myself. I am in captivity. I am in captivity not with someone, but with someone. Someone who is much stronger than me. Someone without a face. Someone who doesn't know me. But I know him. I know he doesn't have a name. But even if it wasn't, he would still know me, I'm sure of it. Because he knows everything. He cannot be wrong about this. And he is not wrong.
