Download the Manual in Adobe PDF format. Modulation of growth factor-mediated mitogenesis by imidazoline, histamine and related compounds. An immunocytochemical study was undertaken to investigate the effects of two structurally related compounds, imidazoline and histamine, on the proliferative response to several growth factors, including PDGF-BB, basic fibroblast growth factor (FGF) and tumor necrosis factor-alpha (TNF-alpha). The results suggest that imidazoline and histamine exert an inhibitory effect on growth factor-induced proliferation in both mesenchymal (NRK) and epithelial (A549) cell types. However, a direct effect of imidazoline and histamine on growth factor

receptor signalling and downstream signal transduction is not implicated, since no inhibitory effects of imidazoline and histamine on EGF-induced phosphorylation of the epidermal growth factor receptor, p44/p42 MAP kinase and p90RSK were 2d92ce491b
