A classification scheme, in short, is a way of arranging knowledge in a particular way and thereby making it more comprehensible and retrievable. There are two types of classification schemes: formal and informal. The formal scheme is applied to the name of classification is to classify a taxon to give the same name as already in existence. For instance, a formal classification of ichthyology would only allow to arrange the fishes of a particular group based on how they are related in their evolutionary history and names could therefore be arranged in a tree-like fashion (tribal system). It is useful to keep in mind that the informal scheme arranges things in whatever way the people wished to organise and classify them. SYSTEM: A systematic arrangement of information—in particular that which is organized according to a code or scheme. One example of a formal system of classification is the Dewey Decimal Classification System, which is used in libraries to organise their collection. The informal system of classification is employed in the production of most, but not all, indexing systems in the United States. CLASSIFICATION OF FUNGI By ALEXOPOULOS A system of classification may be used to classify ba244e880a
