The streptococcal Pal protein is a member of a large family of proteins that carry out two functions: (i) The conversion of l-phosphoenolpyruvate (PEP) to l-lactate by catalysing the dehydration of the PEP substrate into pyruvate and (ii) the dissipation of the proton gradient in a chemiosmotic reaction. The crystal structure of Pal was solved at 1.7 Å resolution. In the crystal, the protein exists in a non-inhibited, open form and an inhibitor- 2d92ce491b
