## **What's New In?**

SNMP is a standard protocol for configuring and management of network devices. Almost all active network devices support SNMP. Besides that, SNMP is supported by many network applications and the majority of operational systems. The SnmSet application will allow one to change the values of SNMP variables on network devices supporting this protocol and, in this way, to manage them. Many different actions are realized by means of writing values to variables. This can involve the changing of configuration parameters of a network device and enabling and disabling different features or executions of some certain actions. Thus, SnmSet allows you to uniformly administer different active network devices and network programs. Note: SnmGen is free for non-commercial use and/or as a part of non-commercial solutions by third-party companies. The Sysstat package is a cross-platform free system monitoring and logging facility. It logs and reports on system activity, including system events, queries, events received from the system, and current system state. It also has a number of installation options allowing tracking different aspects of system usage, such as different installations, log management, and remote notification via the Internet or email.
