## FULL Lego Mindstorms Vision Command - Windows XP ~ Team ZOIT

The Choice Demands a Response! A goal of the US military effort in Iraq is to not only to keep insurgents from returning to Iraq and provoking their political movement in neighboring countries but also to teach the Iraqi leaders how to not allow the same insurgents to re-enter Iraq again. Closed-loop control is the most common method of control. This is where the controller is sampling the system state and accordingly the outputs of the controller are fed back to the control input to the system. The most simple control method is open-loop control or feedforward control that only depends on the present system state and does not include a feedback mechanism. Simply put, the control loop does not use any information received from the feedback of the output to refine the control action. Some of the risks associated with these decisions are: 1) Needing to deal with the political constraints of unified command, the geographical dispersion of forces, and the inflexibility of conventional forces. 2) High degree of physical risk associated with any deployment of unconventional forces. 3) Difficulty of capturing and adapting the technology from outside of the military since the public is generally averse to experimentation. It is important to use the best available information to determine the best action for each situation. The physical constraints we faced in our inventory control problems were over-consumption of the inventory, over-production, and availability of the inventory. Each of the three variables is given a range of values from which it must operate. Obviously, having too much inventory can be a problem, as we may not be able to sell the inventory at the optimum time to our customers. Similarly, having too much inventory can lead to overproduction, as we may be tempted to produce too much inventory just to keep it on hand. Having too little inventory, however, can lead to underproduction and loss of sales, as we may only be producing inventory for excess orders. Therefore, we must set the minimum and maximum quantities for each inventory item and the balance between the minimum and maximum quantities. The physical constraints we faced in our driving problems were the ideal driving speed and how to minimize the time a vehicle took to get from point A to point B. We knew that the ideal speed was 60 mph, the ideal time to take 2 hours and the maximum distance was 150 miles. This is given as a constraint, with either speeds or distances of zero allowed. From here, we needed to find out how much of each of the two constraints was best in each situation. We had three different types
