****_Adobe Photoshop 6_**** : Most people who buy Photoshop will also purchase a copy of Adobe's Creative Suite. Photoshop is the core part of the program—an incredible tool for photographers, illustrators, graphic designers, and web designers. ****Figure 6-14:**** With Photoshop, a layer mask is the key to working with a layer. Photoshop also has numerous plug-ins for more complex editing. As the name implies, the plug-ins add more functionality to the program. ****_Adobe Photoshop Elements 6_**** : Because Photoshop has become so sophisticated that new users find it impossible to understand, many Photoshop users now use **_Elements_**. Elements is a nice version of Photoshop that is easier to work with and has much better plug-ins. If you're a beginner, this is a good program to start with. ****_Adobe Photoshop Lightroom 5_**** : Lightroom is available as a stand-alone product (which is good because Lightroom only edits images as you import them and doesn't touch them on your hard drive at all). In that version, you import your images, edit them, and then save them. Lightroom works great for photographers. Other good programs for the beginner include Paint Shop Pro and Corel Photo-Paint. Illustrators may prefer to use the Adobe Illustrator program to create drawings and illustrations. Some people prefer to use InDesign to create layouts for printed materials.

The invention relates to a protective cap for a medical delivery device, and in particular to a mouthpiece that provides both a seal and protection for oral hygiene needs. Certain medical delivery devices such as breathing tubes and tracheostomy tubes require some sort of protective cap. Typically such caps are adapted to prevent leaks of fluids from the device, and to prevent contamination of the device by oral fluids. While many caps currently exist, they do not provide a sufficient means to maintain a seal around the mouthpiece. By means of example, U.S. Pat. No. 7,352,552 describes a clamp that can be used to provide a seal, but it uses a complicated structure with a top and bottom portion that creates gaps between the top and bottom portions. This creates a seal only at the top and bottom portion and does not provide a seal around the entire perimeter of the mouthpiece. In addition, the cap cannot be retained around the mouthpiece with a strap or elasticized band, as this causes the cap to break off from the shaft or breathing tube in use. U.S. Pat. No. 6,201,851 describes a mouthpiece for use with a breathing or tracheostomy tube, but does not provide any discussion of sealing the mouthpiece. U.S. Pat. No. 4,870,957 describes a mouthpiece that can be used for administration of a medication in solution or powder form, but does not provide any discussion of a seal. U.S. Pat. No. 6,971,374 describes a mouthpiece that can be used with a breathing tube, but does not provide a seal. U.S. Pat. No. 6,941,526 describes a mouthpiece with a seal around the perimeter, but does not provide an easily attachable strap that can be kept on the mouthpiece. U.S. Pat. No. 7,520,294 describes an articulator that can be used with a breathing tube, but does not provide an easily attachable strap that can be kept on the mouthpiece. U.S. Pat. No. 6,858,101 describes a mouthpiece that can be used with a breathing tube, but does not provide an easily attachable strap that can be kept on the mouthpiece. U.S. Pat. No. 8,434,488 describes a mouthpiece with a high elongation fabric strap, but does not provide a continuous seal around the mouthpiece

While most such tools are based on text-based approaches, it has recently been shown that stochastic Boolean networks and Bayesian networks can serve these purposes well. In this paper, we introduce the construction of two such visual analytic tools, NetworkAnalyzer and StochMM. These are constructed on top of the bioinformatics Python module, Biopython 1.0 and can be used to simplify the task of biological pathway analysis, including the modeling, visualization and analysis of drug response networks. We demonstrate the use of these tools in the analysis of a set of chemogenomic gene expression data in the elucidation of the apoptotic response of human acute promyelocytic leukemia cells to chemotherapy drugs. The analytic results are placed into context by adding additional biological data to the results. Both tools are available from our website at [Following this paper by Jensen and Younes, the authors are invited to state any supplemental materials.](#)Effects of forelimb lesions on tongue position in rats. Measurements of excursion of the tongue in the oral cavity were made in the awake behaving rat. The results indicated that the tendency of the tongue to move in the horizontal and vertical planes was not influenced by lesions of the forelimbs. The excursion of the lingual musculature was influenced by forelimb lesions. The extent of excursion in the horizontal plane was correlated with the extent of movement of the forelimbs, although after lesions of the forelimb the ability of the rat to manipulate food dropped by several centimeters did not seem to be influenced by the movement of the tongue.[OSEN=??]◆
